QUESTION 431Your company network has an Active Directory forest that has one parent domain and one child domain. The child domain has two domain controllers that run Windows Server 2008. All user accounts from the child domain are migrated to the parent domain. The child domain is scheduled to be decommissioned. You need to remove the child domain from the Active Directory forest. What are two possible ways to achieve this goal? (Each correct answer presents a complete solution. Choose two.)
A. Run the Computer Management console to stop the Domain Controller service on both domain controllers in the child domain.
B. Delete the computer accounts for each domain controller in the child domain. Remove the trust relationship between the parent domain and the child domain.
C. Use Server Manager on both domain controllers in the child domain to uninstall the Active Directory domain services role.
D. Run the Dcpromo tool that has individual answer files on each domain controller in the child domain.
Answer: CDExplanation:<http://technet.microsoft.com/en-us/library/cc755937%28v=ws.10%29.aspx> QUESTION 432Your network consists of a single Active Directory domain. The domain contains 10 domain controllers. The domain controllers run Windows Server 2008 R2 and are configured as DNS servers. You plan to create a new Active Directory-integrated zone. You need to ensure that the new zone is only replicated to four of your domain controllers. What should you do first?
A. From the command prompt, run dnscmd and specify the /createdirectorypartition parameter.
B. Create a new delegation in the ForestDnsZones application directory partition.
C. From the command prompt, run dnscmd and specify the /enlistdirectorypartition parameter.
D. Create a new delegation in the DomainDnsZones application directory partition.
Answer: A QUESTION 433You want to prevent nonadministrative users from joining computers to the domain.What should you do?
